28/09/2001

Chuvas Intensas/Forte

No dia 29/09 (sábado) uma área de instabilidade associada a uma baixa pressão sobre a Argentina provocará chuvas fortes sobre os RS. Estas chuvas deverão ocorrer principalmente no período da tarde, estendendo-se pelo noite e madrugada. Não descartados chuvas de granizo em algumas localidades. Deverão ocorrer ventos de rajada, com velocidades de até 50 nós (25m/s) no leste e sul deste Estado. No dia 30/09 (Domingo) o dia será chuvoso em toda a região, podendo ocorrer chuvas fortes em várias localidades.

09/11/2001

Chuvas Intensas/Fortes

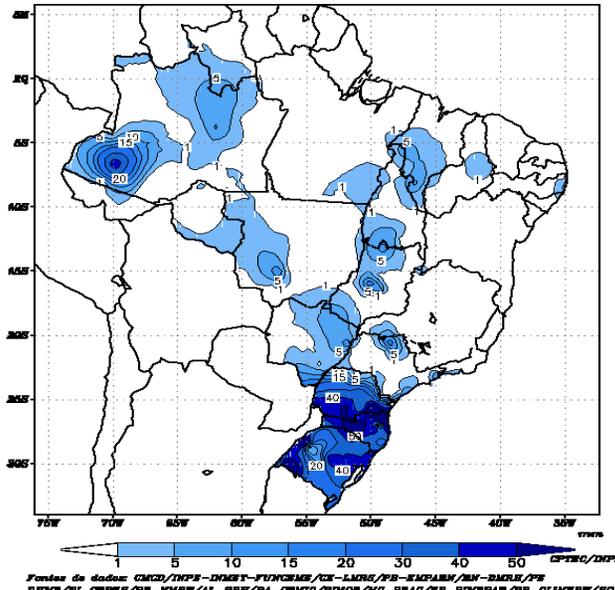

No dia 10/11 (sábado): Uma frente fria provocará chuvas fortes do RS. De acordo com o modelo de previsão são esperadas CHUVAS FORTES, principalmente no final da manhã e período da tarde, em toda a região de fronteira com o Uruguai e na região de Uruguaiana. No dia 11/11 (Domingo): Na madrugada e período da manhã deverá chover forte no setor norte, serrana e litoral do RS. No final da manhã e período da tarde também deverá chover forte em várias localidades de SC e do RS.

**PREVISÃO DE TEMPO PARA GRANDE SP
DEFESA CIVIL ESTADUAL**

Fuente de dados:
CPTEC - Centro de Previsão de Tempo e Estudos Climáticos

Previsão de Tempo para o dia: 28/03/2001

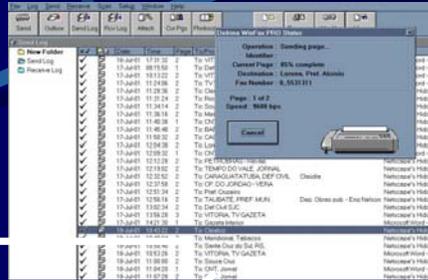

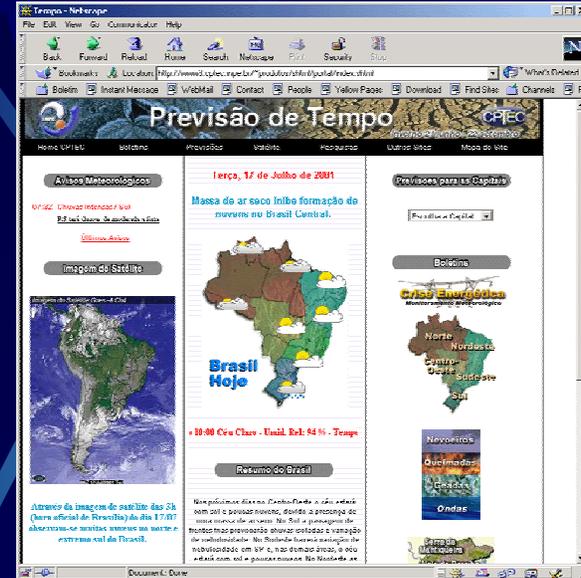

Através da imagem de radar observa-se chuva no norte de SP/Campesina. A imagem de satélite indica a frente fria no sul de SP e áreas de nuvens convectivas no sul, sudoeste, leste e nordeste paulista.

PREVISÃO PARA A GRANDE SP:

Hoje 28/03: A influência de uma frente fria está favorecendo condições de chuva no sul, sudoeste e oeste do Estado de SP no hoje. Nas áreas da Grande SP há chuva fraca na zona norte e sudoeste da Capital e no norte da Região de SB Campos. As áreas de chuva deverão atingir a região central de SB Campos, nas próximas horas, e essas chuvas poderão ser de intensidade moderada. No decorrer da tarde, será possível ocorrer clima de intensidade moderada nas áreas da Grande SP.

Qualquer novas informações estamos em contato.

Previsão de Tempo

Terça, 17 de Julho de 2001

Massa de ar seco inibe formação de nuvens no Brasil Central.

Brasil Hoje

18:00 Cto. Chuv. - Unid. Exp. 94.6% - Temp.

Resumo do Brasil

Atmosfera de satélite: O dia 17 de julho apresenta condições de pancadas de chuva no fim de dia nas áreas da Grande SP, Vale do Paraíba e nordeste de SP e sul de MG, devido ao forte aquecimento. Amanhã (18), com a aproximação de uma frente fria a possibilidade de pancadas de chuva e trovoadas serão maiores e deverão acontecer já no início da tarde e ao longo do dia em SP, especialmente no leste e nordeste de SP, RJ e sul de MG. No dia 21/03, o dia será chuvoso no leste e nordeste paulista, RJ e sul de MG e chuvas esparsas nas outras áreas de SP e de MG.

Sumário Executivo

No mês de junho, as chuvas mais significativas ocorreram no extremo norte do Brasil, leste da Região Nordeste e no Rio Grande do Sul. Nas demais áreas do país as chuvas ficaram abaixo da média climatológica. No Brasil central, desvios negativos de chuva ocorreram devido à fraca atuação das frentes frias, associada a uma situação de bloqueio atmosférico no Oceano Pacífico Sul. Em decorrência do comportamento anômalo das frentes frias, as temperaturas ficaram mais elevadas em praticamente toda região central do Brasil e em parte do Sudeste Brasileiro. No mês de junho ocorreram seis frentes frias, sendo sete a média para esse mês.

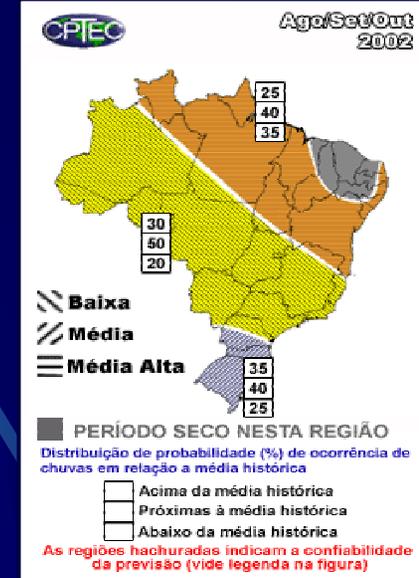

Dois frentes frias, nos dias 12 e 22 de junho, causaram queda significativa de temperatura na Região Sul. Durante a sua trajetória pelo interior, os sistemas frontais causaram aumento nebulosidade e chuvas fracas.

Entre os distúrbios informacionais estão as chuvas ocorridas no centro e norte do Chile, que enfrentou uma das piores chuvas nos últimos 100 anos.

Durante o mês de junho a Temperatura da Superfície do Mar (TSM) esteve anormalmente quente em até 1°C entre as longitudes de 170°E e 105°W, no Pacífico Equatorial. Os modelos oceânicos de previsão dos centros europeu e norte-americano (ECMWF e NCEP, respectivamente) previram a evolução do fenômeno El Niño até o final de 2002, ou início de 2003.

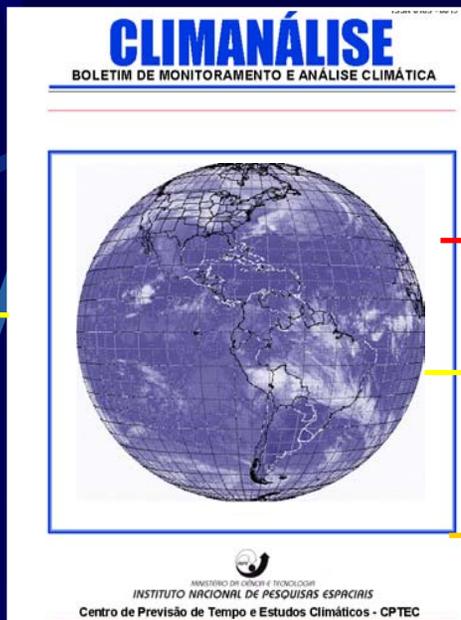

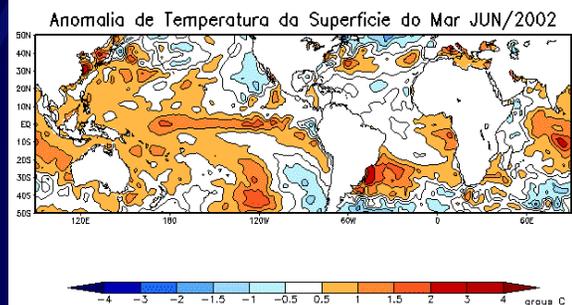

A previsão de chuvas para o trimestre ASO é de precipitações variando do normal a ligeiramente abaixo da média no norte da Região Norte (alta confiabilidade) e sul e leste da Região Nordeste (média confiabilidade). No Rio Grande do Sul e Santa Catarina as chuvas serão de normais a acima da média (média confiabilidade). Nas regiões sudeste e centro-oeste, a previsão é de chuva em torno da normal (baixa confiabilidade). As temperaturas deverão ficar entre a normal climatológica e ligeiramente acima da média na maior parte do país.
