# Online verification of point forecasts

Temperature bias

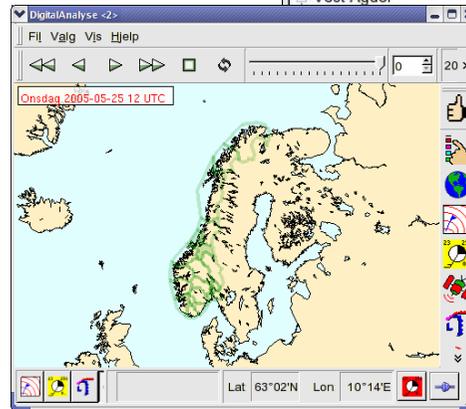

Forecasted/observed weather

# TEXT FORECAST

- Specialized text editor for weather forecasts, recognizing areas and time period. Text for time/areas saved separately in database for reuse
- Translation, meteorological dictionary
- Future: extracting forecast values for monitoring (against obs/models) and verification

The screenshot shows the 'ted' text editor window. The main text area displays a weather forecast for Oslo on Wednesday, May 25, at 18:00. The forecast is for Thursday, May 26, through Monday, June 1. The text is color-coded: 'Oslo, onsdag 25 mai, kl. 18:00' is in black, 'Værutsikter for torsdag 26 mai til og med onsdag 1 juni.' is in green, and regional forecasts are in brown. The regional forecasts are for Nordland, Svalbard, Finnmark, and Sør-Trøndelag. The sidebar on the left shows a tree view of regions: Nordland, Svalbard, Finnmark, Sør-Trøndelag (with sub-items: WEBlang(12) - BM, WEBkort(12) - BM, WEBlang(06) - BM, WEBkort(06) - BM, WEBlang(18, Tir) - f), Troms, Nord-Trøndelag, Møre og Romsdal, Sogn og Fjordane, Hordaland, Rogaland, Aust-Agder, and Vest-Agder. The bottom of the window shows a status bar with 'VA Operasjonell', 'helenk @ foutestdb', and 'Diana'.

# DIANA

- Developed for operational use
- Increased usage by researchers
- Small development crew in close cooperation with forecasters
- Fast development cycle - monthly updates
- Easy to add new applications

## DIANA - interfaces

- Tailored for operational use in a forecasting environment
- Dialogs and Quick menus (Standard and private)
- Most options/preferences and command history in a log to next session.
- Keyboard shortcuts for all functions
- Batch version - identical code base

# Programming environment

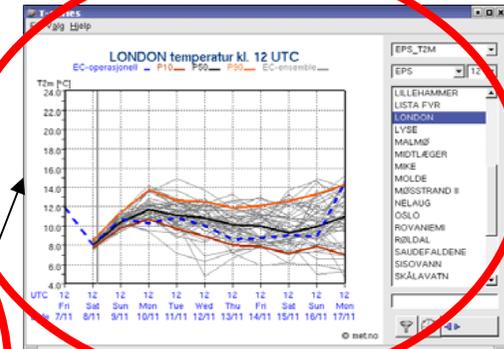

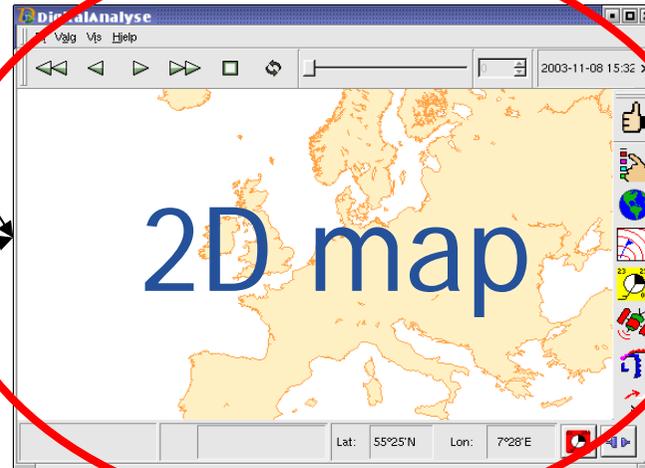

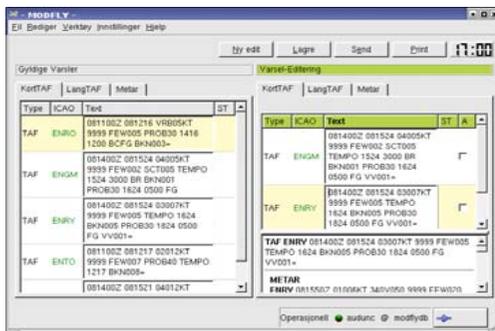

- Linux (Red Hat Fedora Core 3), all *met.no* workstations
- C++ (g++)
- Qt for GUI and window handling, platform independent
- Mesa3D OpenGL
- MySQL databases
- a few other freeware libraries (fonts etc.)
- connections between applications by Qt QSocket
- GPL: Freely available, free to use, free to change  
(from January 2006)

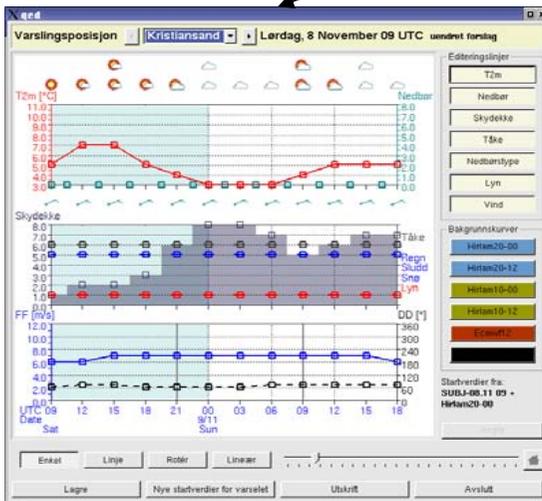

# Open source release, January 2006

	DD	FF	TT	BIAS	RMS	MAE
Observasjon	220	1.00	20.6			
Subjektiv kl.12+24	240	3.0	20.6	2.0	7.5	2.7
Hirtam20 kl.00+36	248	2.9	21.0	2.2	7.7	2.6
Hirtam10 kl.00+36	240	3.2	20.7	1.6	7.2	2.4

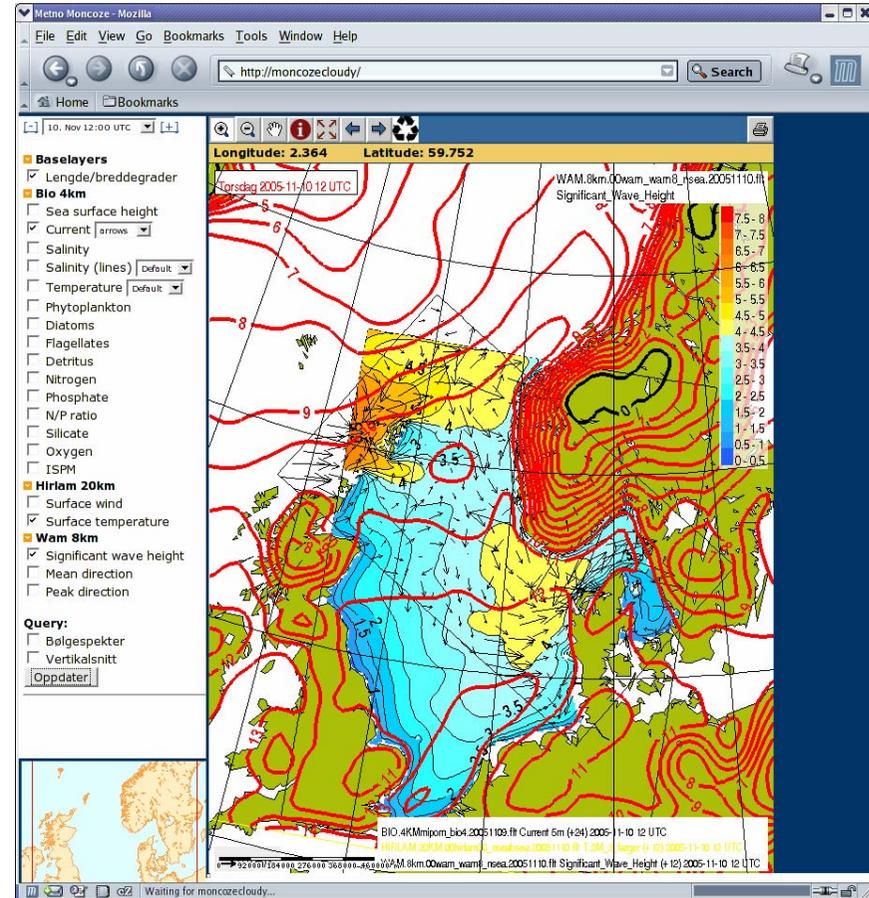

Free software release (GPL), January 2006

- Multilingual dialogs (Qt Linguist translations)
- Make it easier to add other data formats
  - Observation format: BUFR (with an ascii index)
  - Field formats: NetCDF and GRIB (with some index)
  - Image format: HDF5, geoTiff

# Web Map Service

- A standard for showing maps in a web browser
- Defined by Open Geospatial Consortium (OGC)
- Maps can be requested from different servers
- Clients can build customized maps

# Web Map Service

- Batch Diana make plots (png files) to be displayed by a Web Map Service on the fly
- Fast enough to let Diana make new plots when zooming or panning the map
- Interface between WMS and Diana: Now files, will be replaced by a socket connection
- Demand: Support many projections, PROJ4-library (which does not support wind/vector rotation...)

# Future at met.no

Main project: PROFF = "forecasts for the public"

- One gridbased database with controlled and adjusted data.
- Resolution ~4 km.
- This database contains all data needed to make products (Maps, symbols, graphs, texts)
- Possibly sorted to get fast and easy access to point and area data.
- There will be databases with pure NWP to verify forecasters improvements and to point out the need for model improvements.

## Adding value to high resolution data

1. Severe weather information
2. All forecast products should be consistent
3. High resolution forecasts
4. We accept dynamical inconsistencies

## Future at met.no

- Currently, forecasters, researchers and IT-developers discuss how, and to what extent, the forecasters should modify the grid data.
- The further development of Diana highly depends on the result of these discussions.
