

GEMS 2006 Assembly

The Orbiting Carbon Observatory (OCO)

<http://oco.jpl.nasa.gov>

David Crisp, OCO PI
(JPL/Caltech)

February 2006

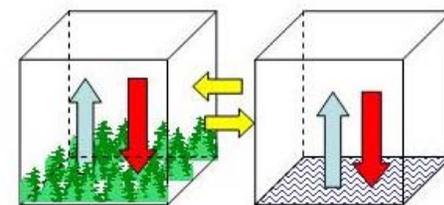

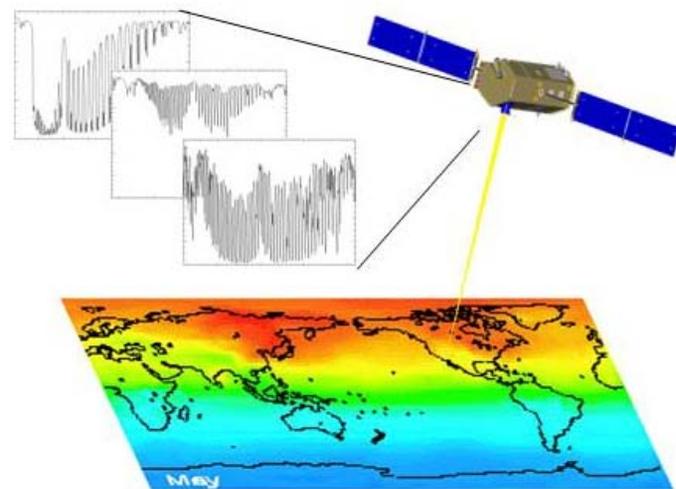

The **O**rbiting **C**arbon **O**bservatory (**OCO**)

OCO will acquire the space-based data needed to identify CO₂ sources and sinks and quantify their variability over the seasonal cycle

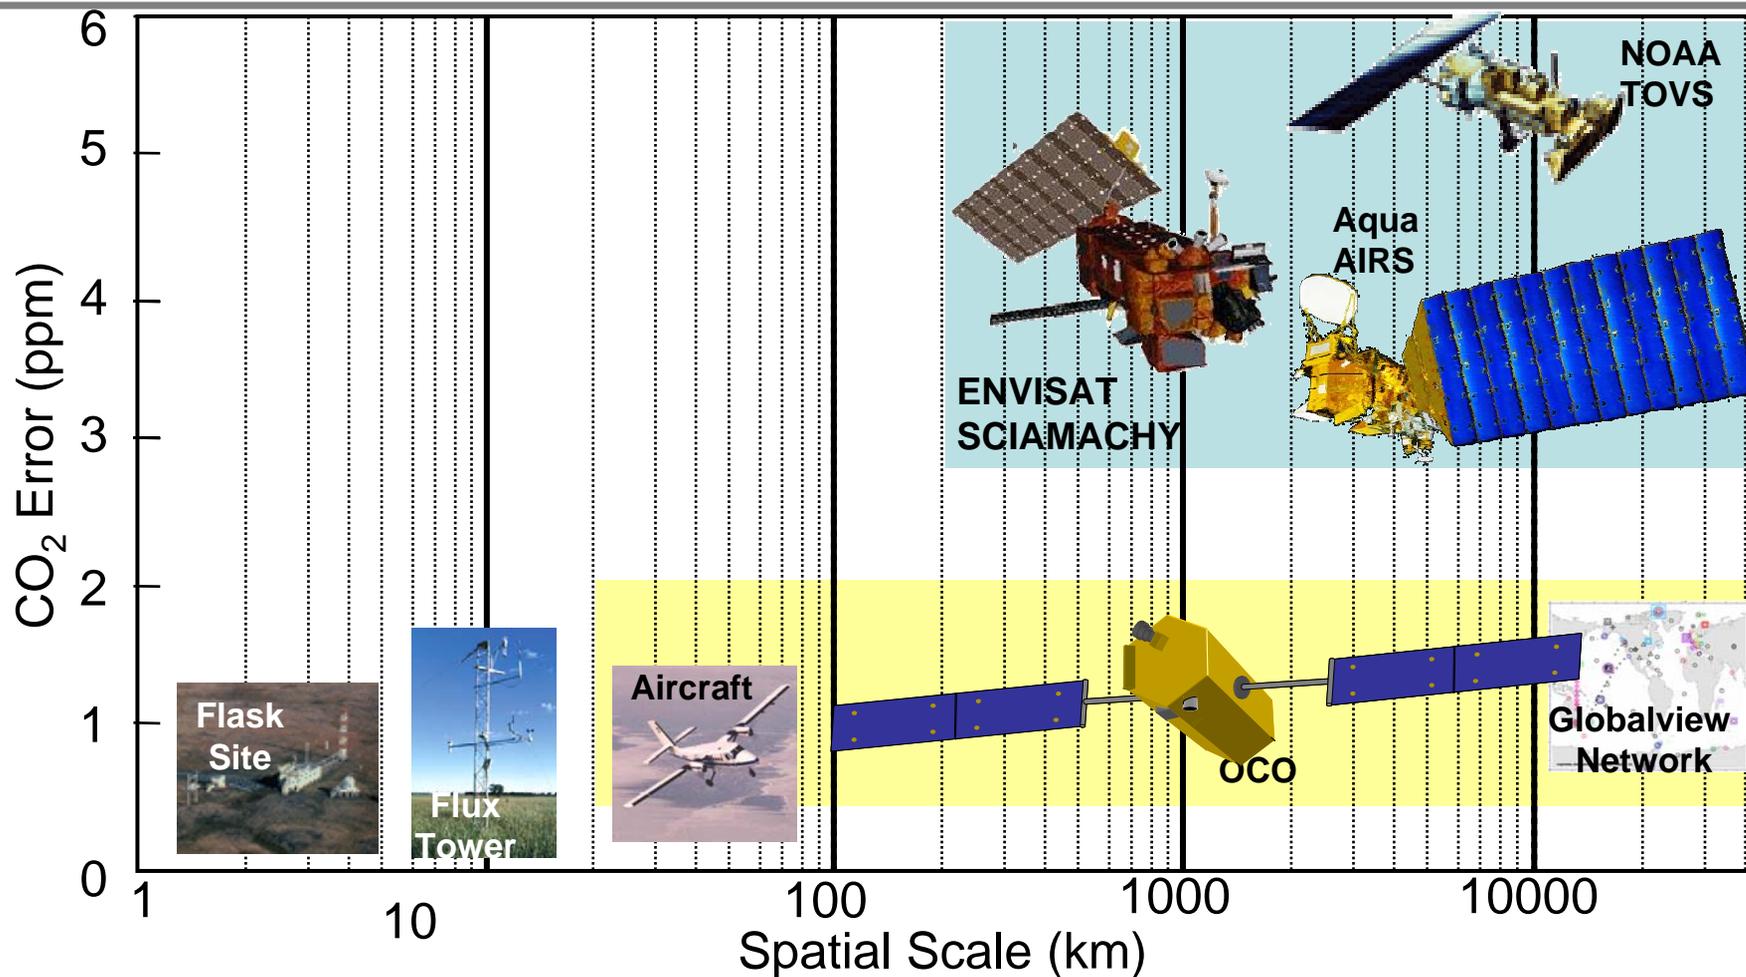

Approach:

- Collect spatially resolved, high resolution spectroscopic observations of CO₂ and O₂ absorption in reflected sunlight
- Use these data to resolve spatial and temporal variations in the **column averaged CO₂ dry air mole fraction, X_{CO_2}** over the sunlit hemisphere
- Employ independent calibration and validation approaches to produce X_{CO_2} estimates with random errors and biases no larger than 1 - 2 ppm (0.3 - 0.5%) on regional scales at monthly intervals

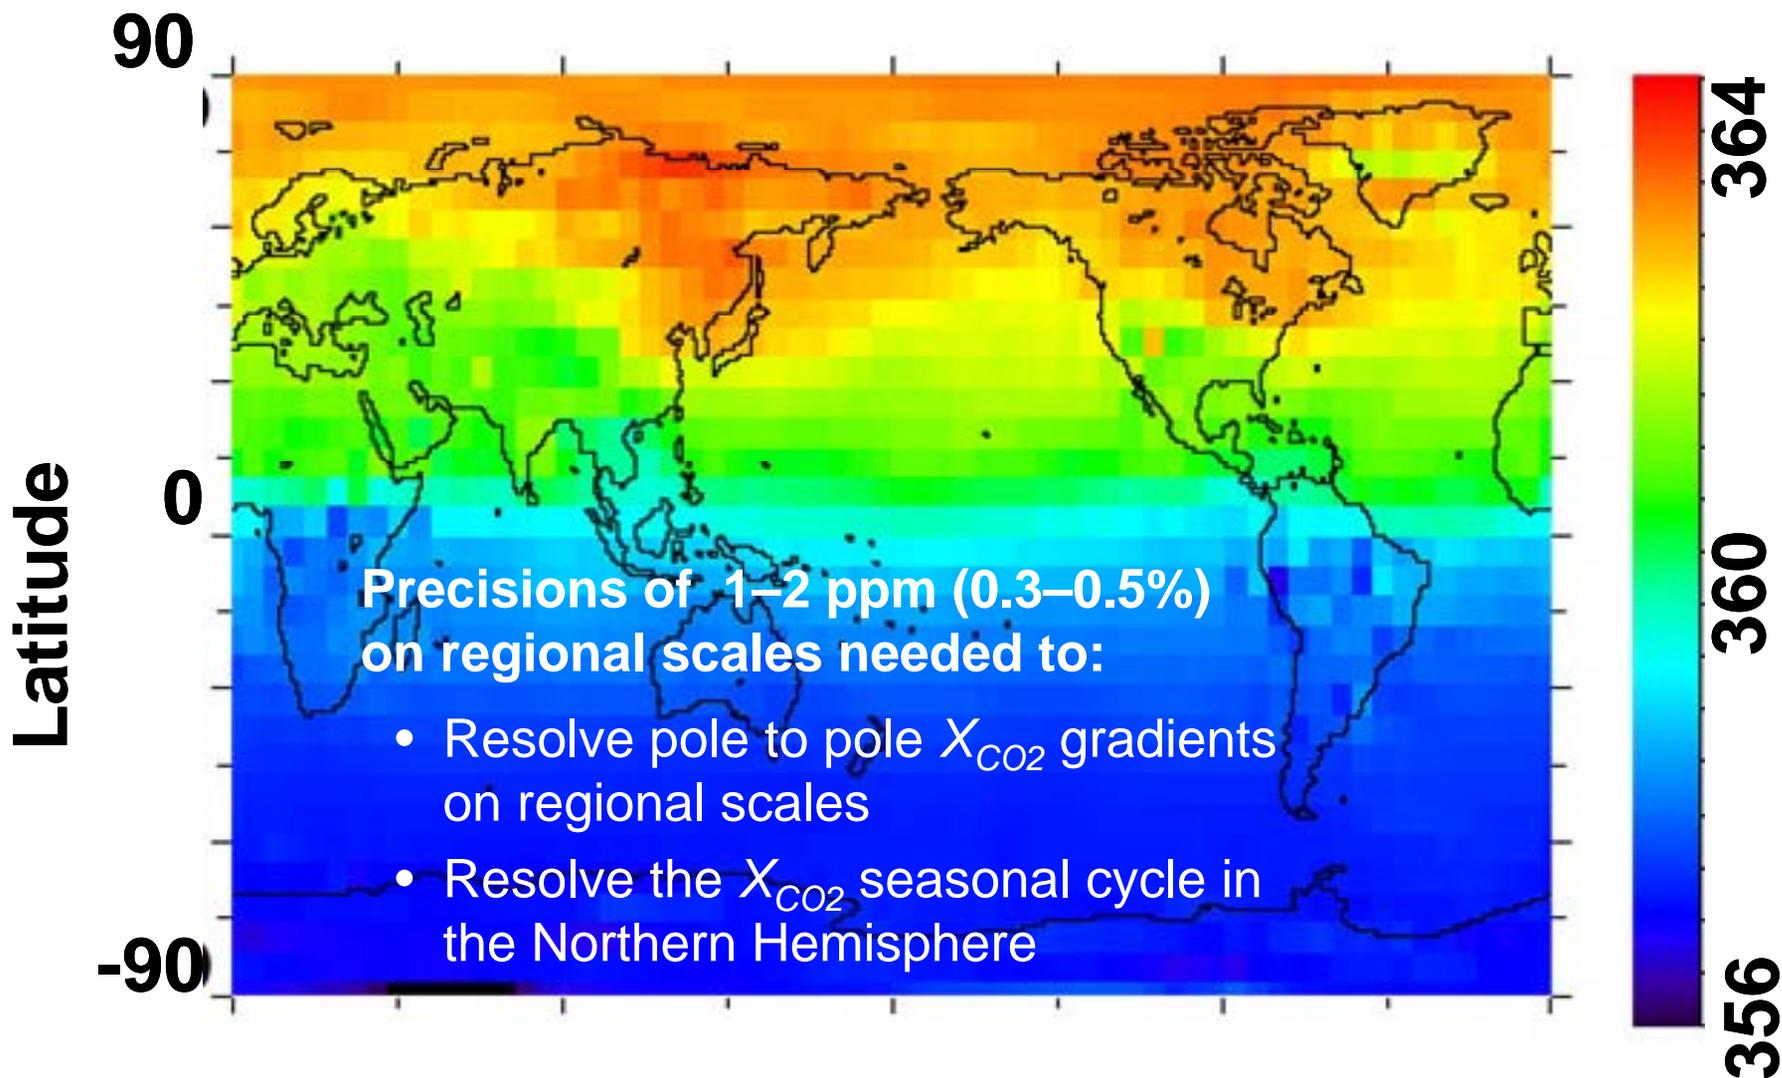

OCO Fills a Critical Measurement Gap

OCO will make precise global measurements of X_{CO_2} over the range of scales needed to monitor CO₂ fluxes on regional to continental scales.

Precise CO₂ Measurements Needed to Constrain Surface Fluxes

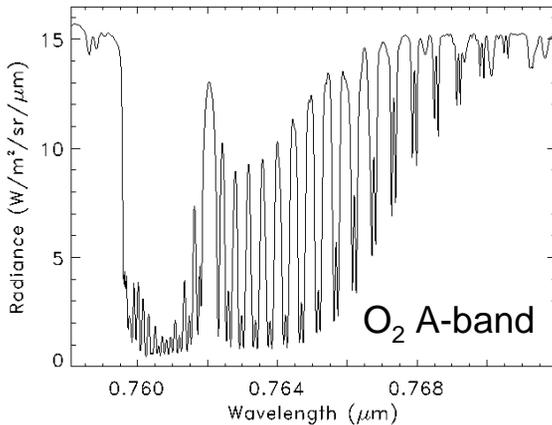

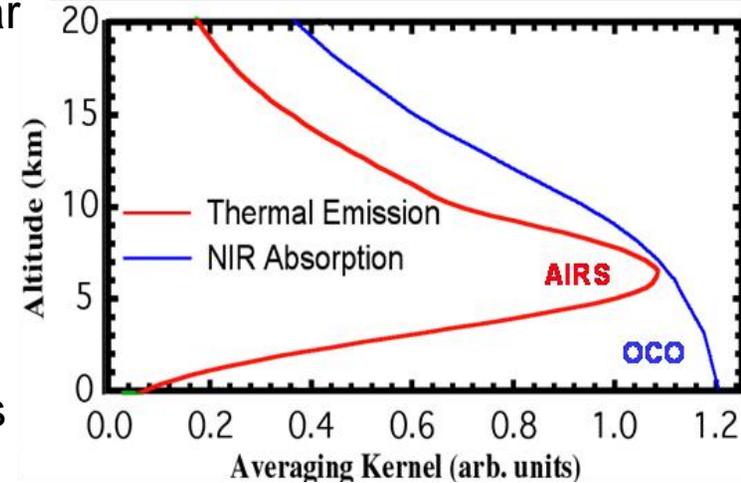

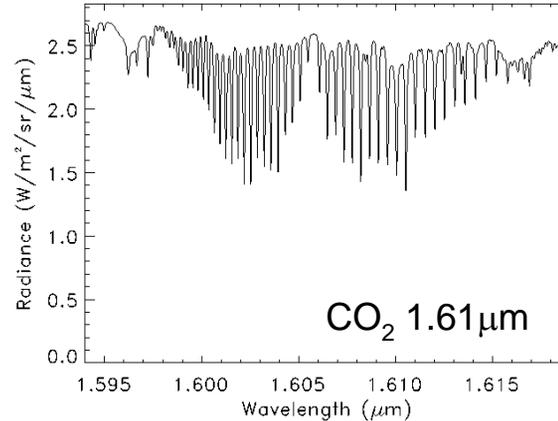

Making Precise CO₂ Measurements from Space

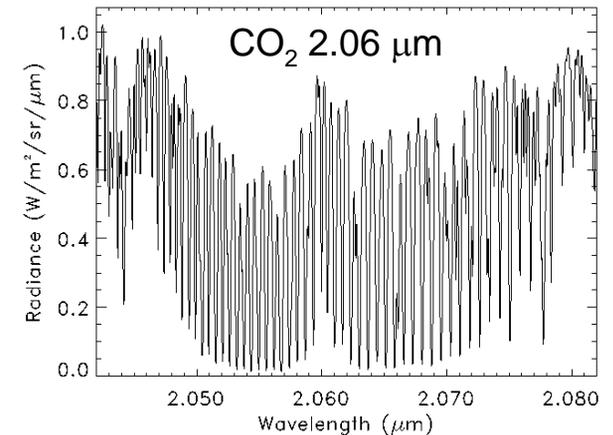

- High resolution spectra of reflected sunlight in near IR CO₂ and O₂ bands used to retrieve the column average CO₂ dry air mole fraction, X_{CO_2}
 - 1.61 μm CO₂ bands – Column CO₂ with maximum sensitivity near the surface
 - O₂ A-band and 2.06 μm CO₂ band
 - Surface pressure, albedo, atmospheric temperature, water vapor, clouds, aerosols
- Why high spectral resolution?
 - Enhances sensitivity, minimizes biases

Clouds/Aerosols, Surface Pressure

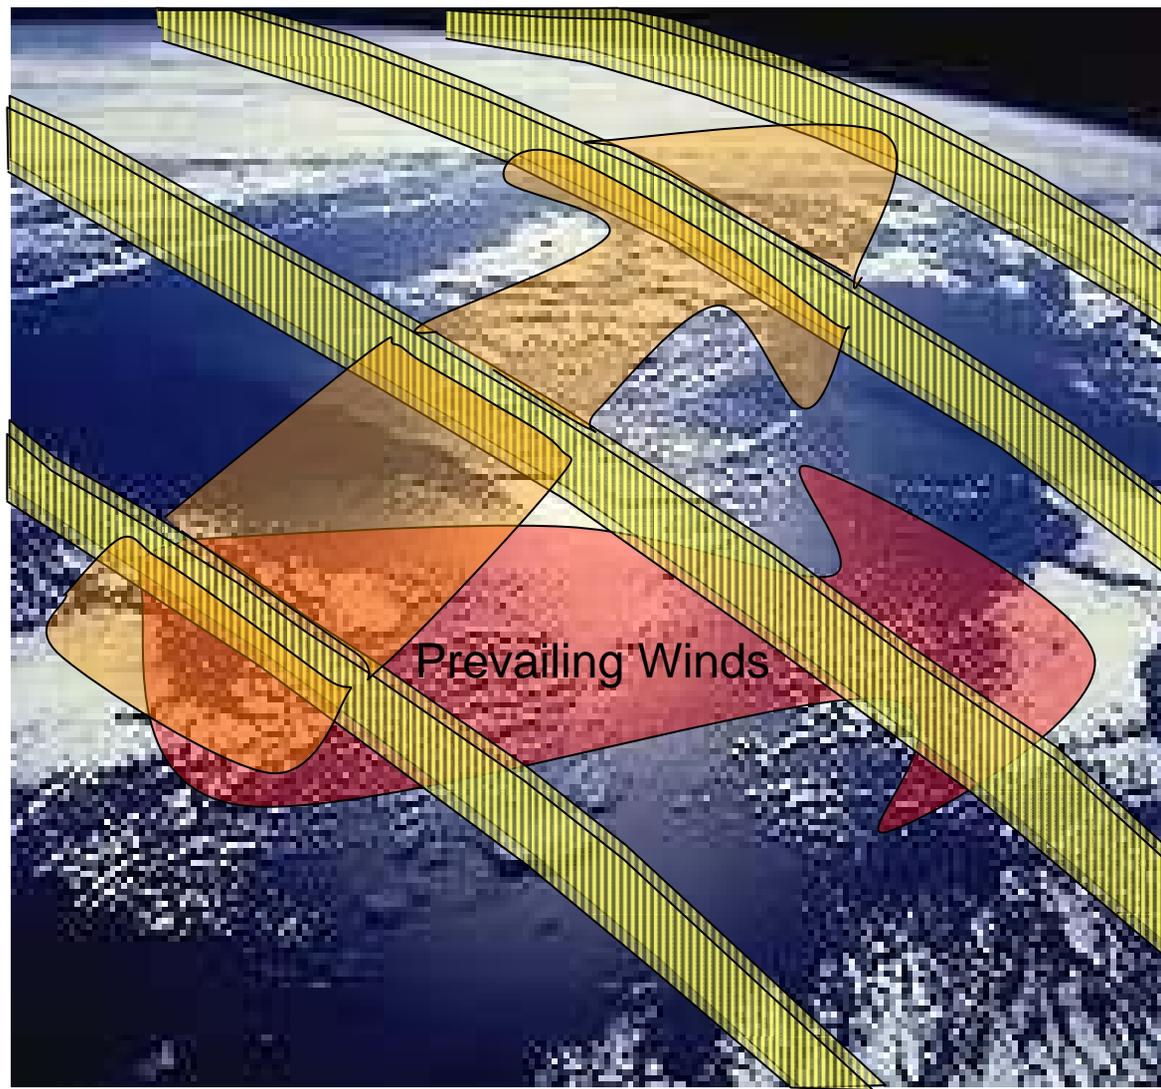

Column CO₂

Clouds/Aerosols, H₂O, Temperature

OCO Sampling over a 16-Day Repeat Cycle

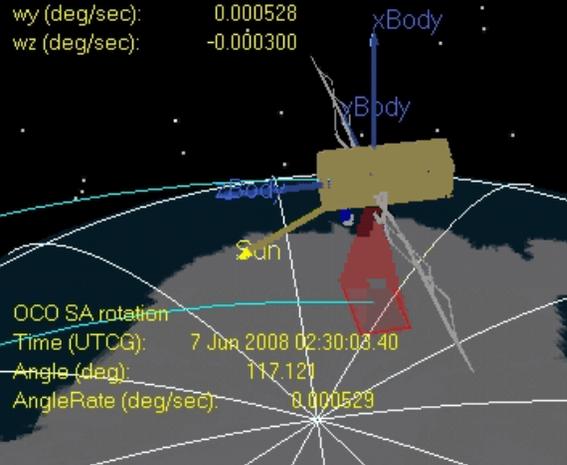

- OCO collects ~7-14 million soundings each 16-day cycle
- CO₂ column measurements complement surface measurement network.
 - Total column CO₂
 - Global coverage with 16-day repeat cycle
- Sampling Rate/Coverage
 - 12-24 samples/second collected along track over land and ocean
 - Glint: $\pm 75^\circ$ SZA
 - Nadir: $\pm 85^\circ$ SZA, 3 km²
 - Longitude resolution 1.5°

Observing Modes

OCO Att Rates
 Time (UTC): 7 Jun 2008 02:30:03.40
 wx (deg/sec): 0.000142
 wy (deg/sec): 0.000528
 wz (deg/sec): -0.000300

OCO SA rotation
 Time (UTC): 7 Jun 2008 02:30:03.40
 Angle (deg): 117.121
 AngleRate (deg/sec): 0.000529

Nadir Observations:

- + Small footprint isolates cloud-free scenes
- Low Signal/Noise over dark ocean

Glint Observations:

- + better SNR over oceans
- More cloud interference

Target Observations:

Tracks a stationary surface

calibration site to collect large

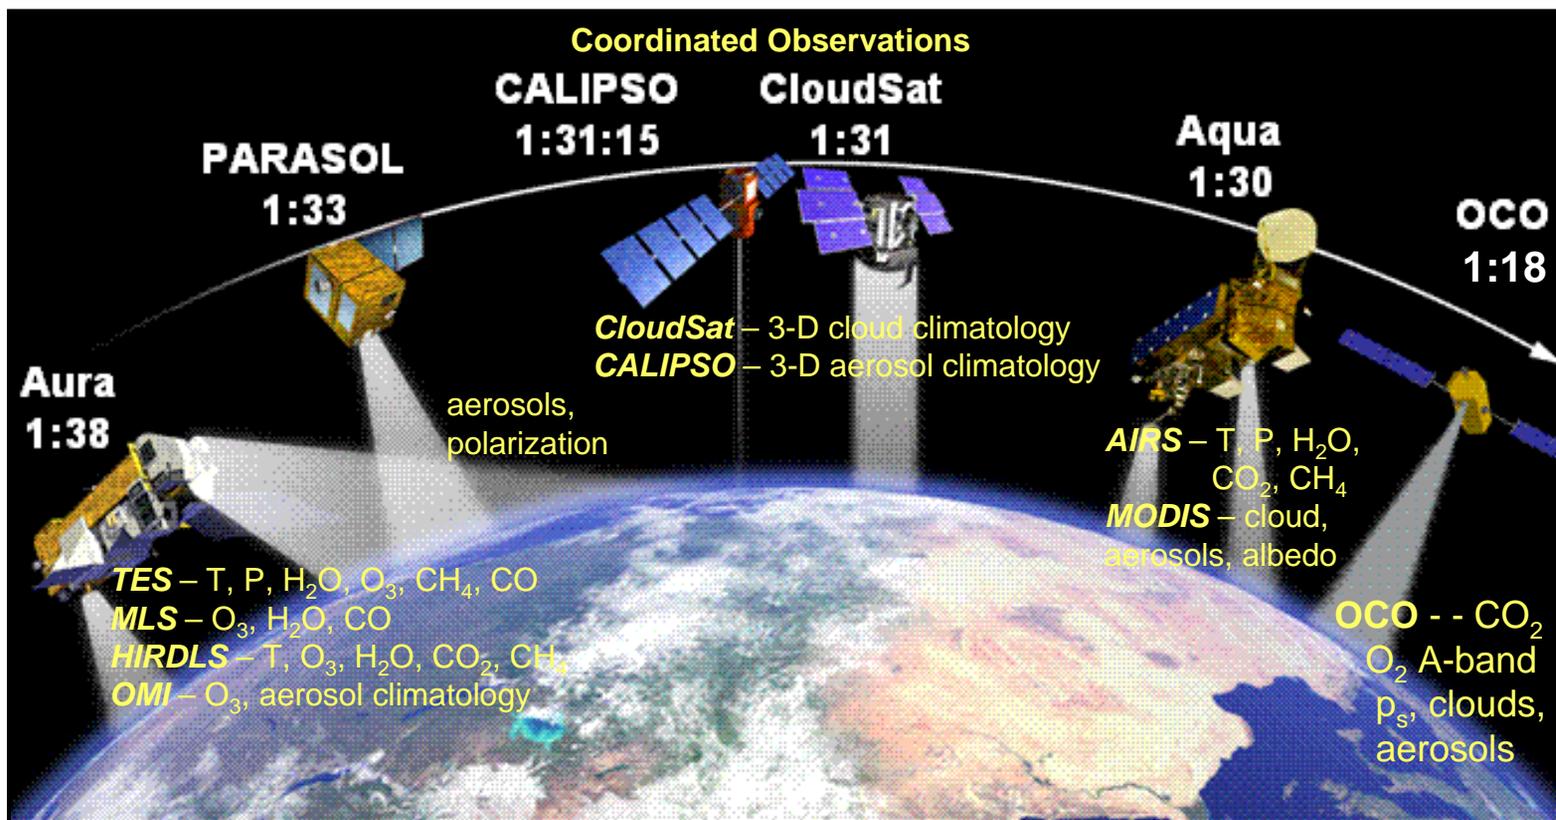

OCO ICR Axes
 7 Nov 2007 02:20:49.40 Time Step: 3.00 sec

OCO Will Fly in the A-Train

OCO flies at the head of the A-Train, 12 minutes ahead of the Aqua platform

- 1:18 PM equator crossing time yields same ground track as AQUA
- Near noon orbit yields high SNR CO₂ and O₂ measurements in reflected sunlight
- CO₂ concentrations are near their diurnally-averaged values near noon
- Maximizes opportunities of coordinated science and calibration activities

Mission Implementation Approach

Project Management (JPL)

- Science & Project Team Leadership
- Systems Engineering, Mission Assurance
- Ground Data System

Single Instrument (Hamilton Sundstrand)

- 3 high resolution spectrometers

Dedicated Bus (Orbital Sciences Corporation)

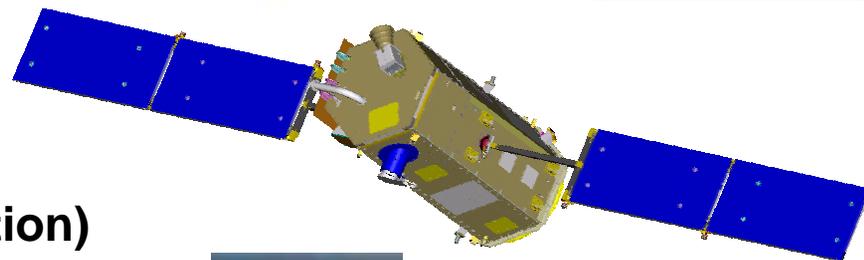

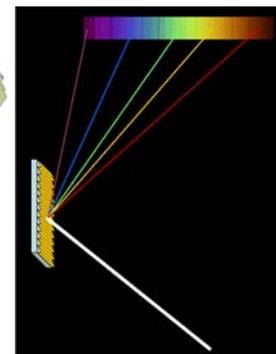

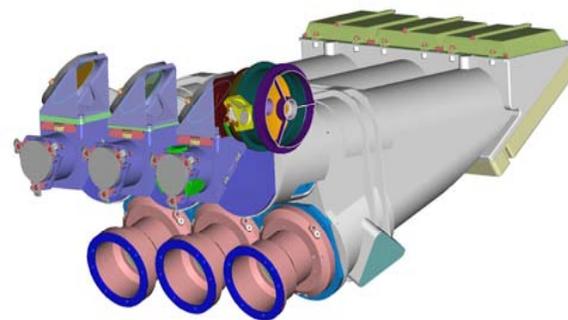

- Heritage: OrbView 4, GALEX, SORCE

Dedicated Launch Vehicle (Orbital Taurus)

- September 2008 Launch from Vandenberg AFB

Mission Operations (JPL)

- NASA Ground Network, Poker Flats, Alaska

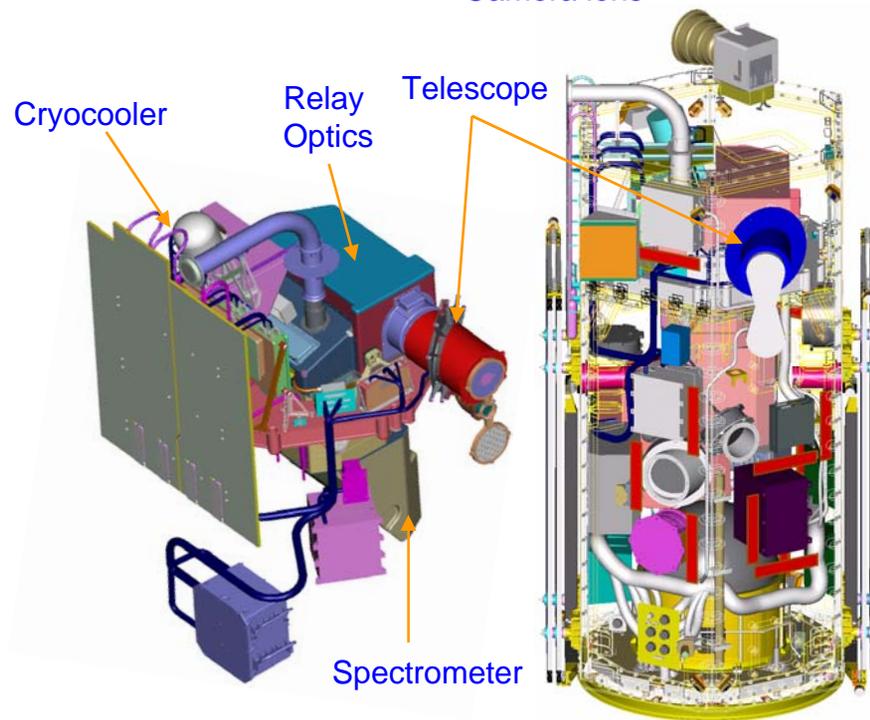

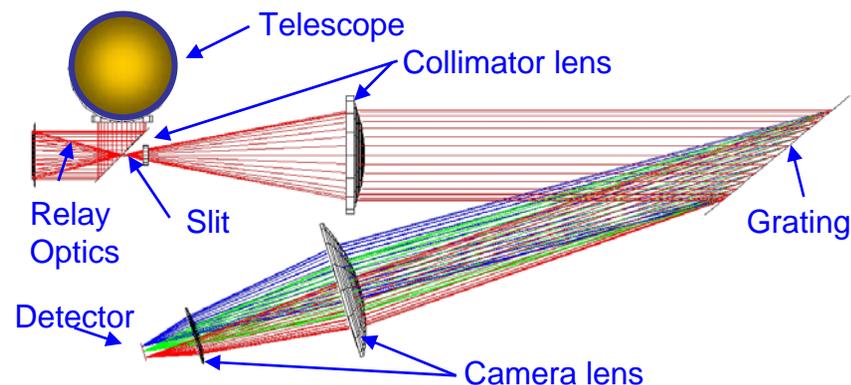

The OCO Instrument

- **Three bore-sighted, high resolution, grating spectrometers**
 - CO₂ 1.61 μm band
 - CO₂ 2.06 μm band
 - O₂ 0.765 μm A-band
- **Similar optics and electronics**
 - Common 200 mm f/1.9 telescope
 - Spectrometers cooled to <0 °C
 - Resolving Power ~20,000
 - Common Read-out Integrated Circuits and electronics for focal plane arrays
- **Existing Designs For Critical Components**
 - Detectors: WFC-3, Deep Impact (RSC)
 - Cryocooler: TES flight spare (NGST)
- **Provided by Hamilton Sundstrand Sensor Systems (Pomona CA)**
 - Provided last 4 TOMS instruments

Calibration/Validation Program Assures Measurement Accuracy

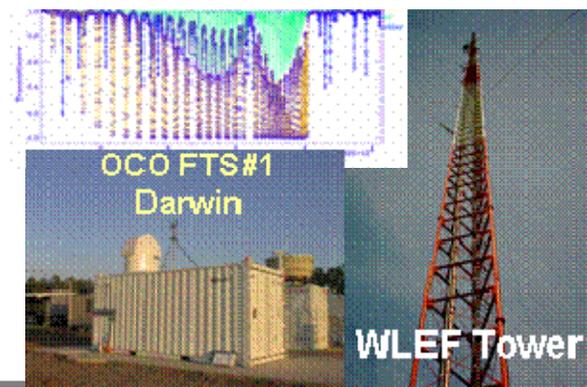

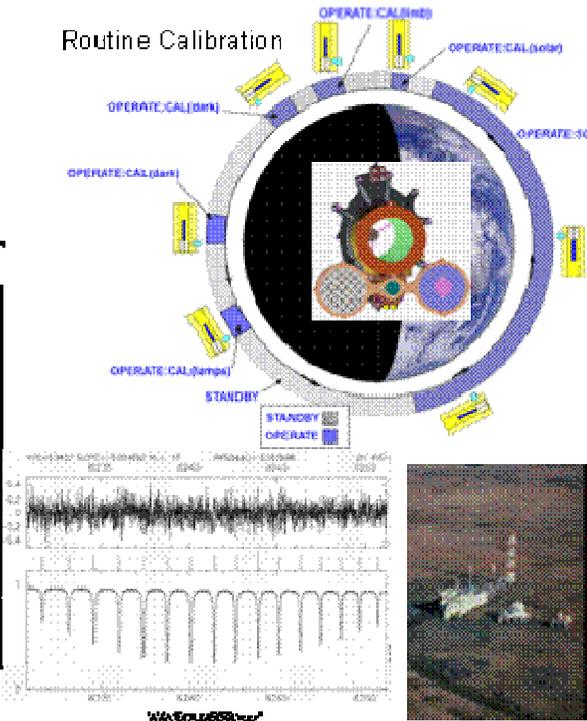

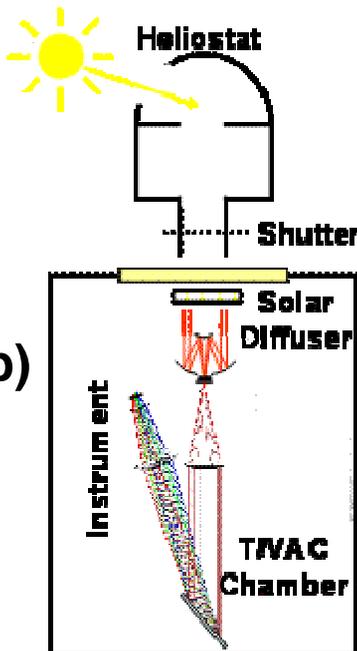

Calibration

- Pre Launch
 - Instrument Subsystem
 - Observatory-level
- On-Orbit
 - Routine (Solar, Limb, Dark, Lamp)
 - Special (Stellar, Solar Doppler)
 - Vicarious

Validation

- Laboratory spectroscopy
 - Spectral line databases for CO₂, O₂
- Ground-based in-situ measurements
 - NOAA CMDL Flask/Tower Network
- Solar-looking FTS measurements of X_{CO2}
 - Measure same bands as flight instrument

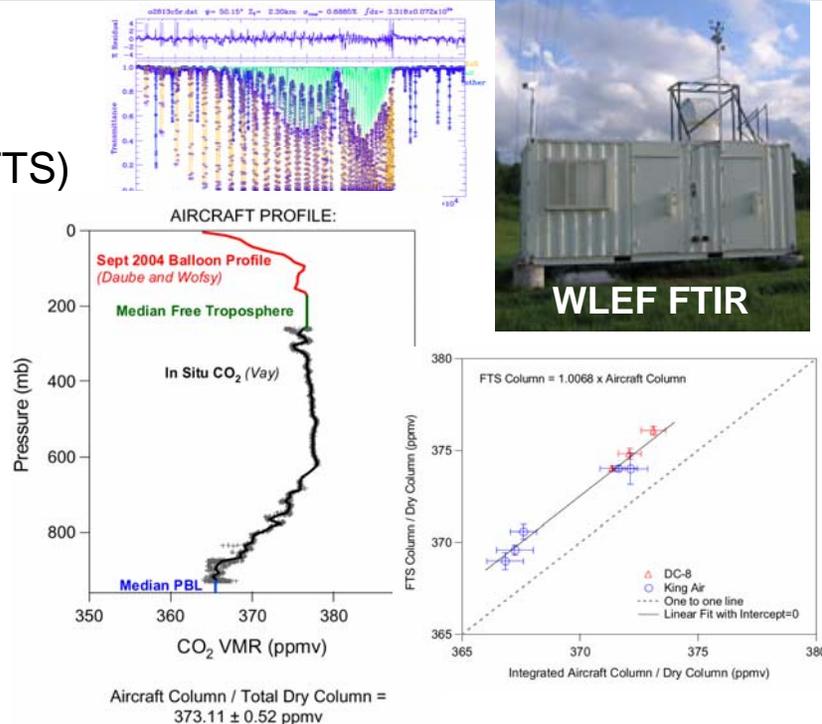

Space-based X_{CO_2} Validation Strategy

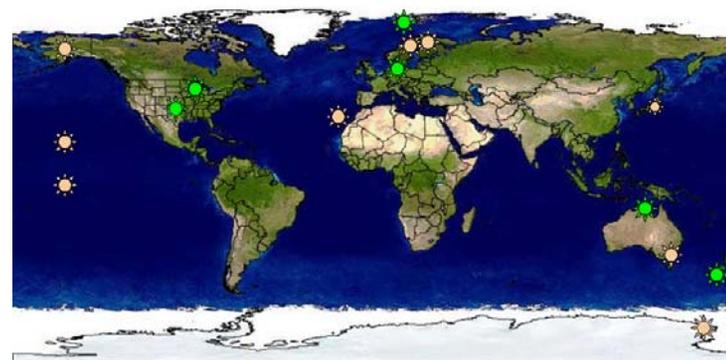

- Validate space-based X_{CO_2} using:
 - Measurements of X_{CO_2} from a ground based network of Fourier transform spectrometers (FTS)
 - FTS and space-based X_{CO_2} processed using same retrieval code

- FTS X_{CO_2} compared to
 - Surface in situ CO_2
 - Tall tower in situ CO_2
 - Column CO_2 integrated from in situ aircraft + sondes

- FTS X_{CO_2} performance tracked via continuous monitoring of:
 - Instrument Line Shape (HCl gas cell)
 - Pointing (Doppler shift, telluric vs solar features)
 - Surface pressure and temperature

Mission Schedule

OCO Schedule

- 7/2001: Step-1 Proposal Submitted
- 2/2002: Step-2 Proposal Submitted
- 7/2003: Selected for Formulation
- 7/2004: System PDR
- 5/2005: Mission Confirmed for Implementation
- 10/2005: Instrument CDR
- 2/2006: Spacecraft CDR
- 7/2006: System CDR
- 11/2006: Instrument Pre-Environmental Review
- 4/2007: Instrument Delivery
- 9/2008: Launch
- 10/2010: End of Nominal Mission
