

# The ERA-CLIM data server

**13th Workshop on  
Meteorological Operational Systems  
Cristian Codorean, 03 Nov 2011**

The context

# The ERA-CLIM project

- Next episode in the ERA series (FGGE, ERA-15, ERA-40, ERA-Interim)
- ERA-CLIM: European Reanalysis of Global Climate Observations
- A 3-year collaborative research project (2011 - 2013) towards:

*Building observational datasets for the predictability of global atmospheric, oceanic and terrestrial processes using reanalysis techniques, with a focus on the past 100 years.*

# The ERA-CLIM project

## Key objectives:

- Improvement of the observational record for the early 20th century
- Preparation of satellite observations, boundary conditions, and forcing data for a global atmospheric reanalysis of the 20th century
- Production of pilot case reanalyses and data quality information
- Development of an Observation Feedback Archive for reanalysis
- Assessment and reduction of data uncertainties

## Additional goals:

- Improving access to climate data, data quality, and transparency
- Developing a sustainable capability for data recovery and reanalysis
- Meeting requirements for future GMES climate services

# ERA-CLIM data recovery and digitisation

- RIHMI (Russian Research Institute for Hydrometeorological Information ) will recover metadata for the stations in their own archive that cover the Former Soviet Union
- 50 000 tapes
- 2 356 000 paper documents for the period 1734-2006
- 719 000 satellite images for the years 1975-2002
- 288 000 microfilms for the period 1881-1998

# ECMWF and ERA-CLIM

- **Development of an Observation Feedback Archive (OFA) - A new web-based facility for access to raw input observations, including uncertainty estimates from reanalysis**
- **Production of pilot reanalyses and data quality information**
  - Database facility for input observations with quality feedback from reanalyses
  - A series of long test reanalyses at various resolutions
  - All reanalysis products and input observations available via web services
- **Assessment and reduction of data uncertainties**
  - Homogenized in-situ data and bias correction techniques
  - Improved ocean observations for reanalysis
  - Tools for quality assessment of reanalysis products

# The WREP project - Motivations

## *Web Re-Engineering Project*

- *New requirements exist that cannot easily be met*
- Increasing use by our supporting states and many commercial customers of our web products
- Users request more tailored products
- Our web service was designed as state-of-the-art in 2001
  - The web has evolved and so have user expectations in usability ...
  - ... New web technologies have evolved to meet these demands
- Our web service cannot currently be relied upon operationally

# The WREP project - Goals

- Redesign the web infrastructure so that the web service is highly available
- Provide on-demand plot production
- Provide more interactivity (e.g. zoom, pan, overlay parameters)
- Allow product customisation (e.g. control the event threshold on probability maps)
- Use open (OGC) standards so that ECMWF products can be embedded in users' own software
- Provide an infrastructure that would easily support current and future application

My role

# Description of work (official)

- **Developing an Observational Feedback Archive (OFA) for observations used in ERA-CLIM reanalyses, including a facility for storing metadata for the observations**
- **Developing a web-based data server for the OFA data server**
- **Developing simple visualisations methods for the OFA data server**
- **Preparing documentation on the web for the OFA data server**
- **Supporting other data services developments**

## Description of work (in short)

- Be sure we provide observations, feedback data and plots to users (mainly external) through a nice web interface

# Requirements

- The need to start archiving observation data in MARS using ODB
- The need for a catalogue describing this data
- The need for a web interface ( possibly reusing what's been done before in terms of web development at ECMWF ) that displays the catalogue and allows retrieval of data

The work so far

## Current status – data

- Observations can now be archived in MARS using the ODB format
- A first set of 'historical' observations has been archived in MARS
- A catalogue has been generated for this data

# Current status – user interface

- Web-based data servers already exist for different projects (ERA-40, ERA-Interim, TIGGE, DEMETER, ...), however ...
- The infrastructure they are based on is not very maintainable, flexible, modular, nor very scalable. It's also quite a few years old and it shows.
- There is the Web Reengineering Project (WREP)
- My tasks extended to migrating old data servers to the new infrastructure, work which also included migrating Webmars

# ERA 15's data portal

## ECMWF 15 Years Re-Analysis

# Where it's going

- 100 years of observation and feedback data in MARS (ODB)
- Catalogue this data and make it available through the web interface for download for the ERA-CLIM project
- Fully migrate Webmars and all other web data servers to the new web infrastructure
- Later, make some statistics available and some nice plots
