

Interactive visualisation and fluent animation of meteorological data in an operational web application based on WMS

Marc Müller

ask – Innovative Visualisierungslösungen GmbH

What this presentation is about

- METFROG
The weather visualisation system at the air traffic control in Germany: Deutsche Flugsicherung (DFS)
- Challenges and best practices handling web-based WMS clients with large amounts of data

ask – Innovative Visualisierungslösungen GmbH

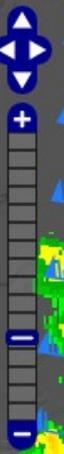

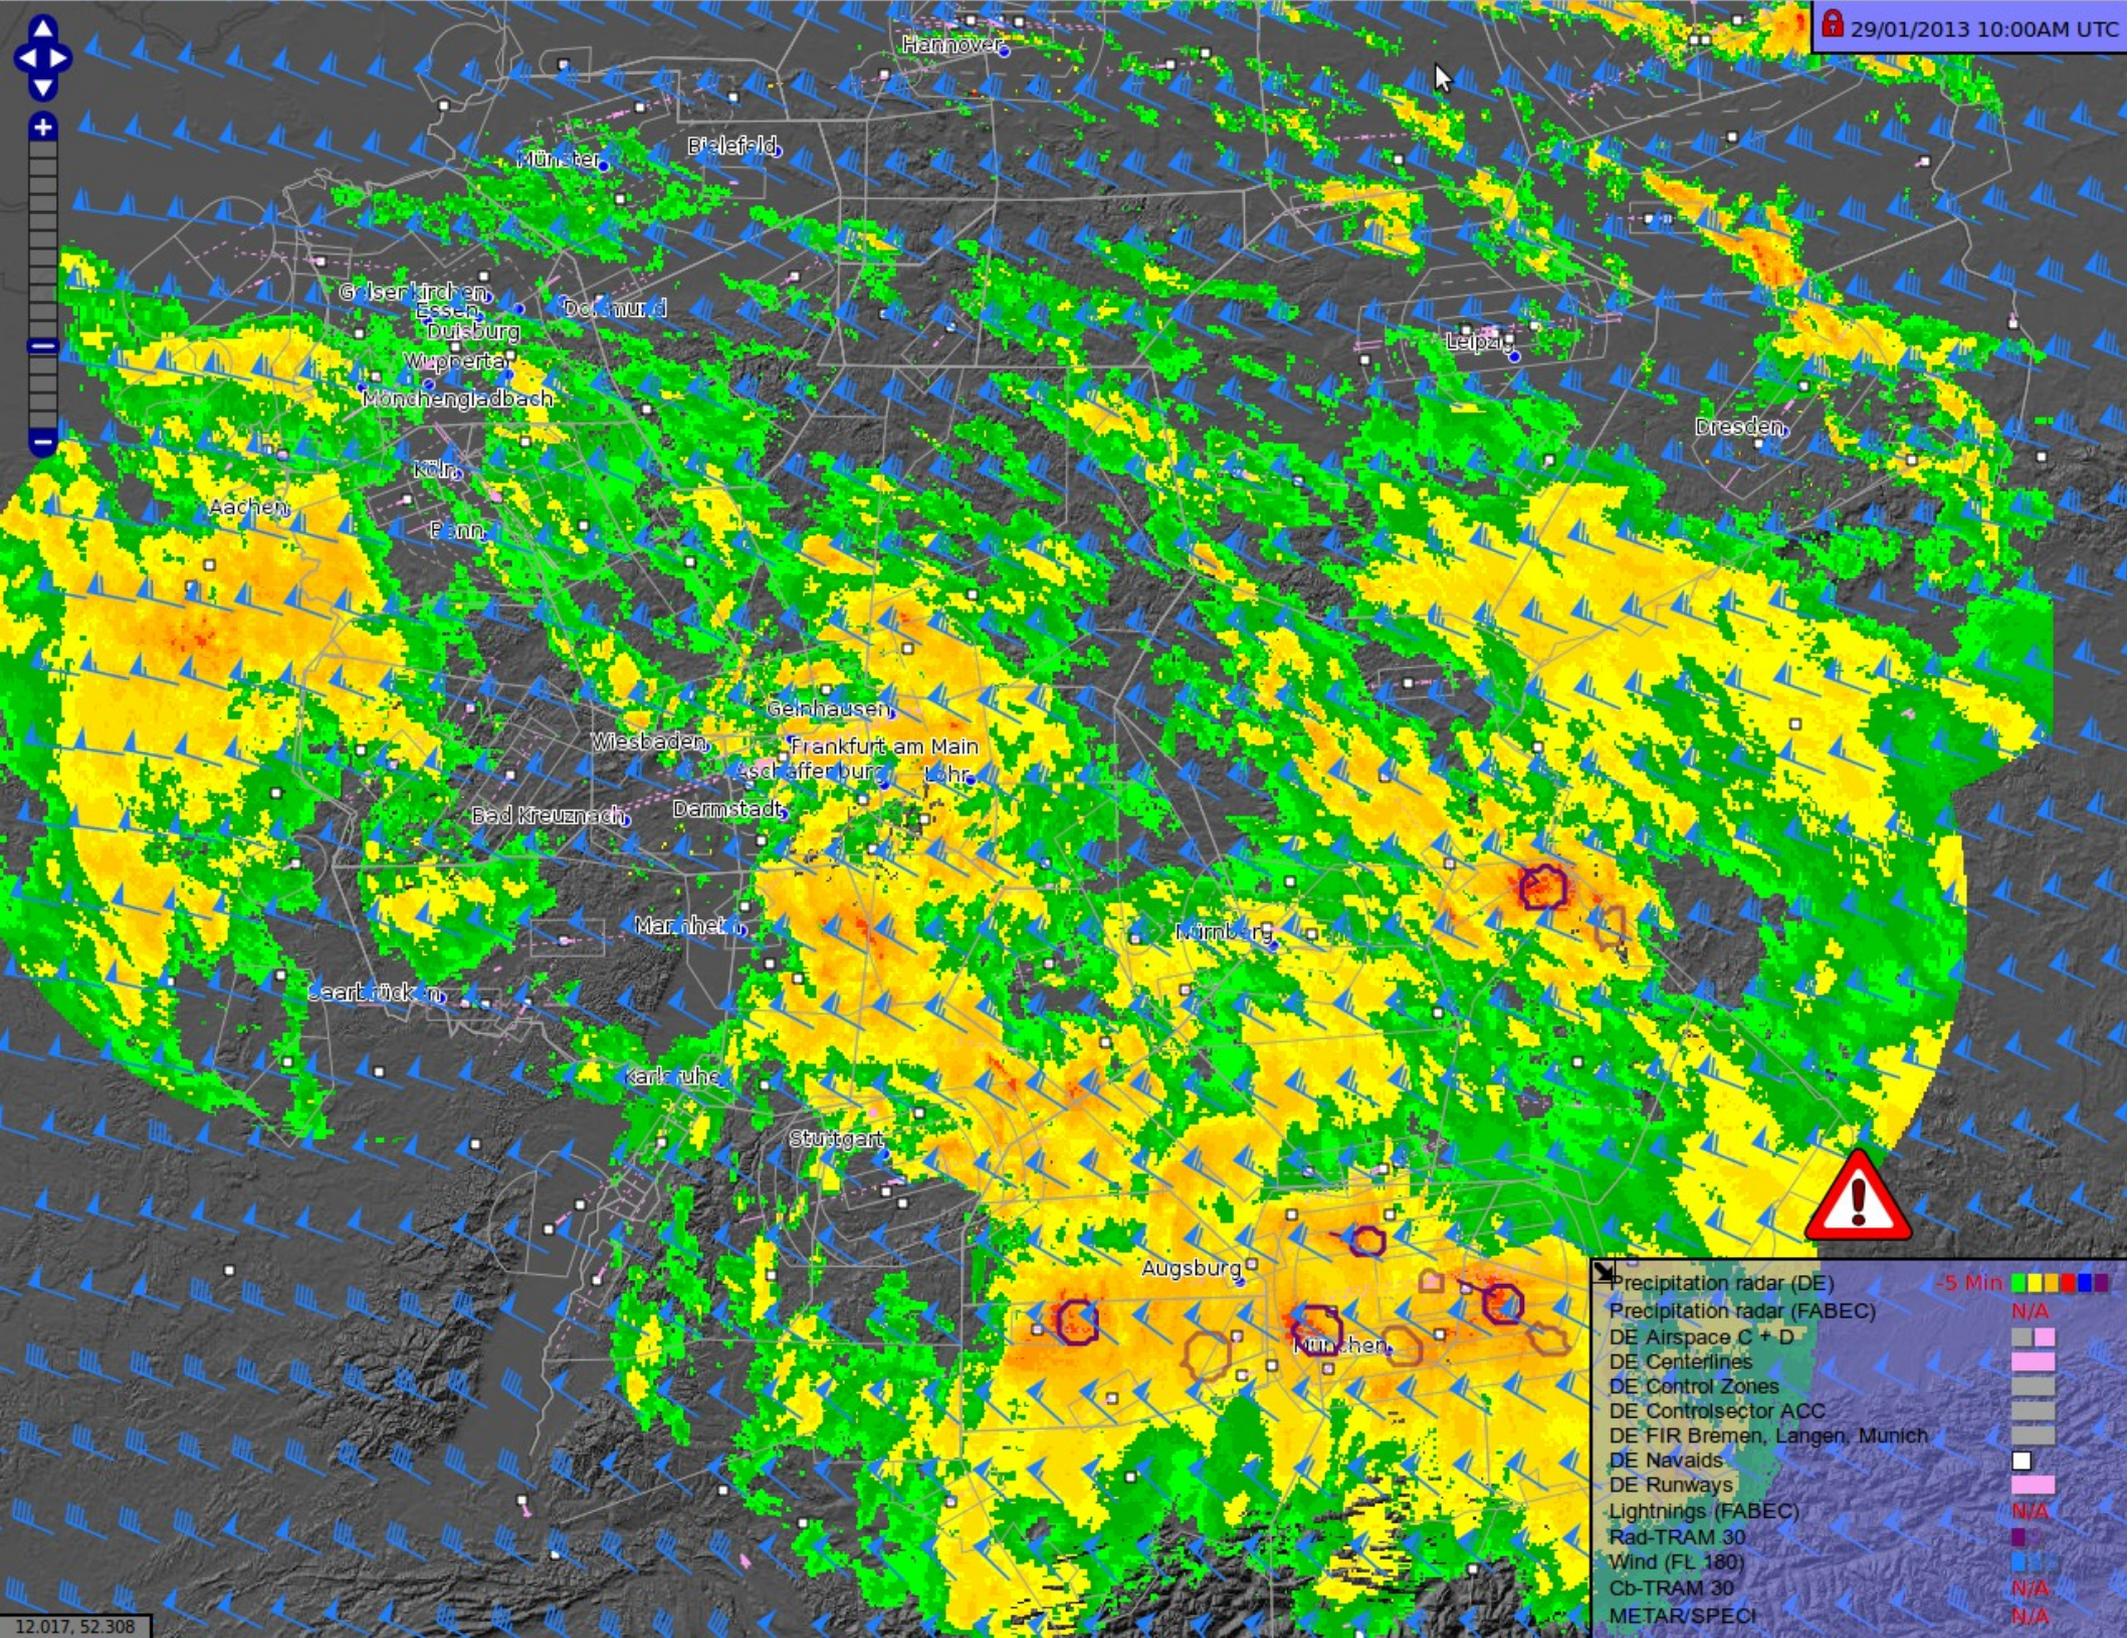

- IT solutions und services since 1995
- Core-Area
 - Visualisation of weather related data in 2D/3D
 - Broadcast Computer Graphic
 - Automated document generation
 - Meteorological workstations
 - Processing of meteorological and geographical data

Requirements for the development of METFROG

- Interactive, multi-layered meteorological workstation
- Browser-based application
- Smooth animation of meteorological data
- Based on open standards
- Completely configurable and extendable within browser
- Handling has to be very simple

Precipitation radar (DE)	-5 Min	
Precipitation radar (FABEC)	N/A	
DE Airspace C + D		
DE Centerlines		
DE Control Zones		
DE Controlsector ACC		
DE FIR Bremen, Langen, Munich		
DE Nav aids		
DE Runways		
Lightnings (FABEC)	N/A	
Rad-TRAM 30		
Wind (FL 180)		
Cb-TRAM 30	N/A	
METAR/SPECI	N/A	

Challenges in design and implementation

- Handling large amounts of data
- Handling time-variant, resolution dependant and multi-source data
- Achieving a high performance despite many seperate layers
- Fluid animation of multiple WMS layers

Available data in METFROG [1/2]

- **Geographical data**
 - **Air control zones**
approach sectors, control sectors, etc.
 - **Airport**
runways, airport locations, etc.
 - **Background images**
 - height map, HR satellite images, OpenStreetMap, etc
 - **Ground-data**
 - streets, city names, borders, rivers, etc.
 - **Etc.**

Available data in METFROG [2/2]

- Time-variant meteorological data:
 - Raster based data
 - radar images
 - Modell output
 - wind: [resolution dependant, multi-source]
 - Vector based data
 - storm cell tracking and prediction
 - Point data
 - lightning, METAR: [resolution dependant]
 - Etc.

Challenges in visualising large amounts of data in a browser [1/3]

- METFROG provides ~80 WMS-Layers thereof ~20 time variant
- A typical map in METFROG consists of 10 to 20 WMS layers, visible at the same time

Challenges in visualising large amounts of data in a browser [2/3]

- Trade off between high server-load (single-tile) vs high client-load (tiled)
- One layer sends between 6 and 30 WMS requests for an update, depending on screen resolution and tile-size
- Typical amount of requests in METFROG...
 - ... for a map @ 1280x1024:
~100 tiles (each 1024x1024px)
 - ... for an animated frame @ 1280x1024:
~30 tiles (each 1024x1024px)

Challenges in visualising large amounts of data in a browser [3/3]

- Common pitfalls
 - Images in the browser cache are not instantly available
 - Many parallel requests to a server do not scale well

Approaches to optimise handling and animation

- Intensive use of caching
- Efficient request management and layer handling
- Using HTML5 features can vastly improve performance and memory footprint

Experiences using WMS for animating meteorological data

- Without optimisation an animation takes 1-5 seconds per frame
 - **Animation is not usable at all**
- With optimisation an animation can display up to 20 frames per second, even on low-end hardware
 - **Animation runs very smooth**

Demo
