$$U \frac{\partial v}{\partial x} + V \cos \theta \frac{\partial v}{\partial \theta}$$

Weather Impact

An aerial photograph of a lush green agricultural landscape. The terrain is divided into numerous rectangular plots, some of which are planted with crops like corn. A small, simple building with a blue roof is visible in the middle ground. The overall scene is vibrant and shows a well-maintained farming area.

Weather Impact

A person is silhouetted against a bright, golden sunset. They are bent over, working in a field, possibly using a hoe. The background is filled with trees and a warm, hazy atmosphere.

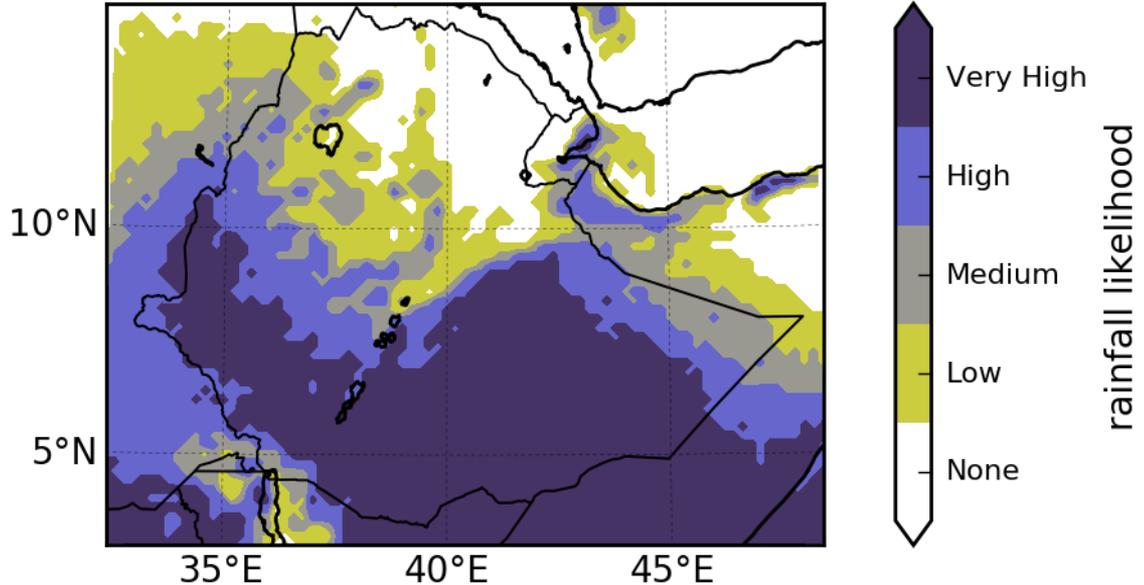

5 critical success factors for mobile weather services in Africa

1. Location specific and reliable forecasts

From “Uncertainty” to “Likelihood”

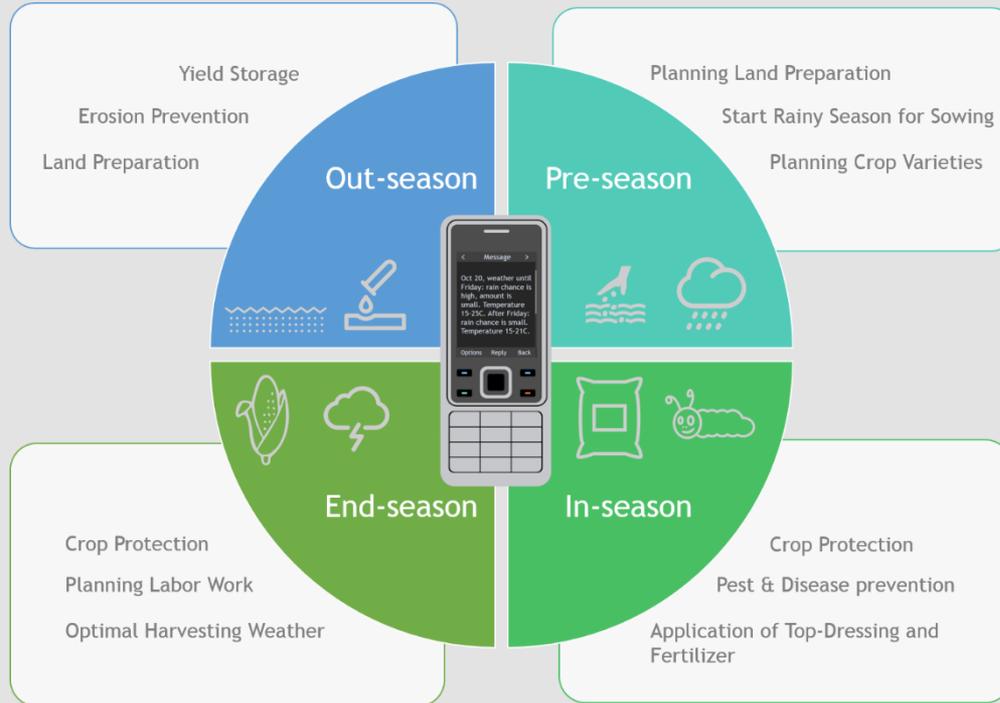

Plikely_classesLongTerm in SMS-date 2018-05-02

2. Information/technology tailored to user needs

Local language and appropriate technology

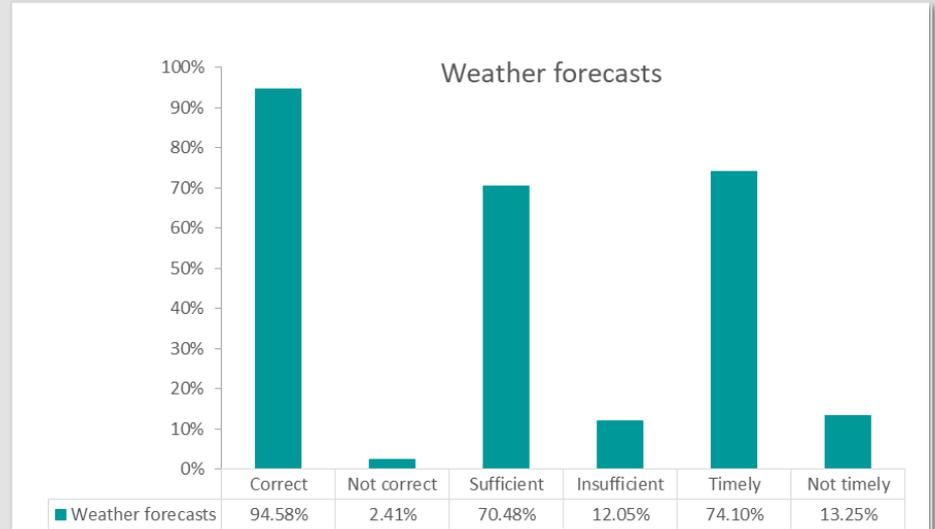

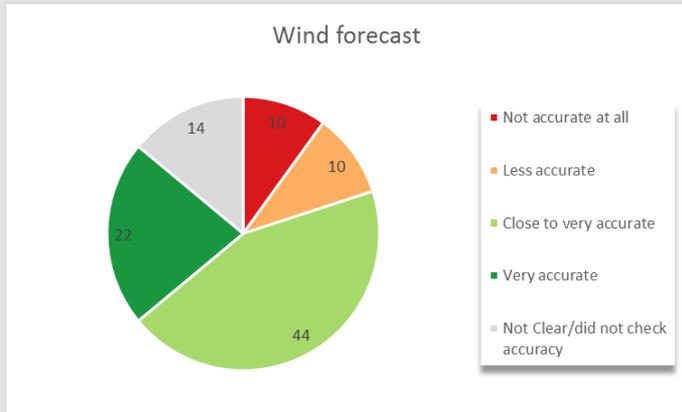

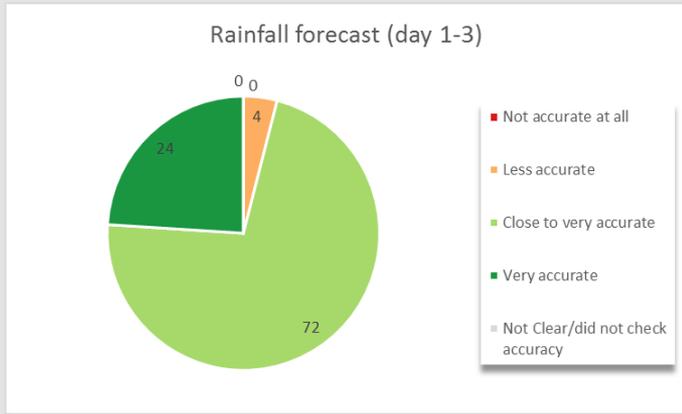

3. Service is embedded in existing local network

Extension networks as “ambassador” of the weather services

User evaluation in various projects

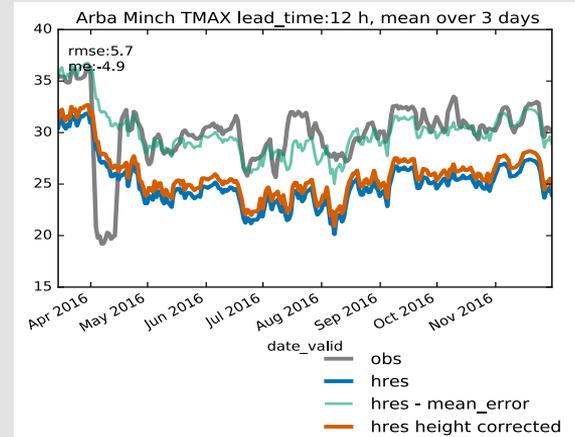

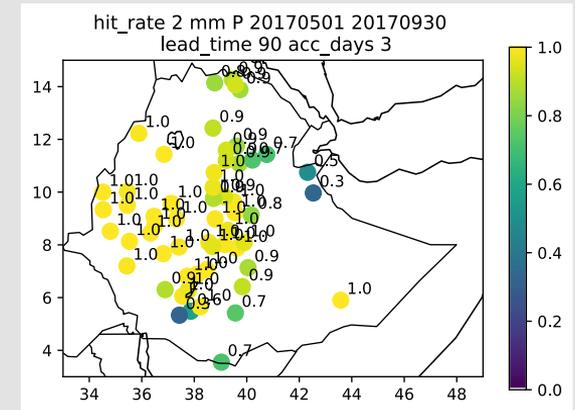

4. National weather services approve the service

Validation of ECMWF forecasts

- Rainfall likelihood good skill:
 - 80-90% accuracy
- Temperature fluctuations are well captured
- Predicting extreme rainfall events is possible, but not straightforward
- Rainfall amount can be improved, performance is very good compared to other models
- Difficulties next to big lakes

5. Involve the right partners for sustainability

- Financial institutes
 - MFI/insurers/banks
- Agro-input suppliers
- Governments
