

# SPECIAL PROJECT PROGRESS REPORT

All the following mandatory information needs to be provided. The length should *reflect the complexity and duration* of the project.

**Reporting year** 2021

**Project Title:** Evaluation, Tuning and Optimisation of Surface Physics Parametrizations in HARMONIE-AROME for NWP forecasting for Ireland

**Computer Project Account:** SPIEGLEE

**Principal Investigator(s):** Emily Gleeson

**Affiliation:** Met Éireann

**Name of ECMWF scientist(s) collaborating to the project**  
(if applicable)

**Start date of the project:** 01-01-2019

**Expected end date:** 31-12-2021

**Computer resources allocated/used for the current year and the previous one**  
(if applicable)

Please answer for all project resources

		Previous year		Current year	
		Allocated	Used	Allocated	Used
<b>High Performance Computing Facility</b>	(units)			3M	
<b>Data storage capacity</b>	(Gbytes)			3M	

## Summary of project objectives (10 lines max)

The overarching goal of this special project was to optimise the surface physics options in HARMONIE-AROME for Ireland.

## Summary of problems encountered (10 lines max)

Some of the problems encountered were:

- The ECOLCIMAP-SG physiography used in cycle 43 of HARMONIE-AROME was not optimal for Ireland with most of our area represented by grassland. This resulted in lots of tests being carried out to try to improve the roughness lengths.
- Another issue encountered and not yet solved is excessive evaporation during Spring and Summer which exasperates our issues with fog prediction.
- A third issue involves too cold night time temperatures and too strong night time winds – a stable boundary layer issue. We partly alleviated this through poor physics – setting the maximum Richardson Number to 0.0, a decision we will soon reverse.

## Summary of plans for the continuation of the project (10 lines max)

We have used all our SBUs but further testing will continue using our national allocation of units.

## List of publications/reports from the project with complete references

Walsh, E., Bessardon, G., Gleeson, E., and Ulmas, P.: Using machine learning to produce a very high resolution land-cover map for Ireland, Adv. Sci. Res., 18, 65–87, <https://doi.org/10.5194/asr-18-65-2021>, 2021.

Keany, E., Bessardon, G., Gleeson, E., Leveraging machine learning to produce a cost effective national building height map of Ireland to create local climate zones. In preparation.

## Summary of results

If submitted **during the first project year**, please summarise the results achieved during the period from the project start to June of the current year. A few paragraphs might be sufficient. If submitted **during the second project year**, this summary should be more detailed and cover the period from the project start. The length, at most 8 pages, should reflect the complexity of the project. Alternatively, it could be replaced by a short summary plus an existing scientific report on the project attached to this document. If submitted **during the third project year**, please summarise the results achieved during the period from July of the previous year to June of the current year. A few paragraphs might be sufficient.

The project SBUs were used to carry out a range of tests to improve on our operational cycle 43 set-up. We were mainly unhappy with our unphysical XRIMAX=0 setting and the use of surface DA to restrict T2m. We carried out a suite of tests for all seasons and came up with new settings that did not rely on the above and yielded similar operational performance. The main surface-related tests conducted included: XRIMAX, ECUME6 – a new sea flux scheme, LICERAD – which improves surface temperatures by making cloud ice more consistent in radiation and microphysics.

The key results are summarised in [https://drive.google.com/file/d/1ZRuPTD2ERVWquqCjeTdB\\_ZzoC8HAgDKF/view?usp=sharing](https://drive.google.com/file/d/1ZRuPTD2ERVWquqCjeTdB_ZzoC8HAgDKF/view?usp=sharing)
